

ALL COVERED

TESTING SERVICES

EVALUATE YOUR NETWORK

Not a week goes by without another report of a data breach where millions of private records were exposed by bad-actors with malicious intent. Many executives understand that their organization's network has security gaps. However, few understand the risk and exposure security gaps pose to their clients and organization. All Covered security testing services will reveal gaps within the network to show our clients how these gaps can be exploited and used against the organization. All Covered specializes in the following testing services:

Web Application Assessment: All Covered will perform internal and external Web Application Assessments following OWASP top issues and industry best practices. Additionally, All Covered performs functional testing on a per-role basis to ensure proper permissions are assigned for Web Applications. In depth testing, such as testing of back-end database integration and security, is also available.

Social Engineering: All Covered will exploit the human layer of an organization's security strategy by deploying tactics, such as phishing emails, spear phishing attacks, phone calls, and physical intrusions, to identify gaps within the security of an organization.

Vulnerability Assessment: All Covered will provide a comprehensive view of known vulnerabilities within the network to better understand the business risk associated with these vulnerabilities. This service will validate current patching activities, establish a baseline, and identify unauthorized assets and other accomplishments.

Application Testing: All Covered's application testing will identify weaknesses within applications that allow attackers to obtain access to critical business data. Application testing will effectively develop an application data map, exploit coding weaknesses and identify mitigation effort recommendations.

Penetration Testing: All Covered's testing team will use real-world techniques to exploit gaps within the network. Exploiting these gaps will illustrate any critical system errors that can ultimately lead to a cyber-security breach. During a penetration test, clients should expect the All Covered team to exploit vulnerabilities, test technical, operational and administrative risk, identify the weakest layer of the network, and other offensive tactics actions.

TAKING IT ONE STEP FURTHER...

All Covered's catalog offers our customers a range of best-practice testing services. Clients can leverage the following service capabilities to expand their security program:

- Active Defense
- Vulnerability Management
- Security Monitoring
- Program Health Checks
- Compliance Assessments
- Security Awareness Training
- Critical Security Control Gap Analysis

All Covered provides best-in-class services that aim to mature our client's security program through our unique process and years of experience. We offer multiple management styles to cater to the kind of program a client wishes to establish. All Covered can fully manage a program, provide assistance to our client, or implement and deploy a program to hand over to the client.
